Distributed Algorithms

Fall 2020

NBAC & TRB 7th exercise session, 02/11/2020

Matteo Monti <<u>matteo.monti@epfl.ch</u>>

Jovan Komatovic <<u>jovan.komatovic@epfl.ch</u>>

Exercise 1 - NBAC & Weak Termination

Devise an algorithm that, without consensus, implements a weaker specification of NBAC by replacing the termination property with

Weak termination: Let *p* be a distinguished process, known to all other processes. If *p* does not crash, then all correct processes eventually decide.

Your algorithm may use a perfect failure detector.

Exercise 2 - NBAC & Very Weak Termination

Devise an algorithm that, without consensus, implements a weaker specification of NBAC by replacing the termination property with

Very weak termination: If no process crashes, then all processes decide.

Is a failure detector needed to implement this algorithm?

Exercise 3 - TRB & \Diamond P

Can we implement TRB with an eventually perfect failure detector $\Diamond P$, under the assumption that at least one process can crash?

Exercise 4 - TRB to Consensus

Design an algorithm that implements consensus using multiple TRB instances.

Exercise 5 - TRB to Total Order Broadcast

Design an algorithm that implements Order Broadcast using multiple TRB instances.
