Failure modes

- Responsive: once \perp , forever \perp
- Non-responsive: no reply

t denotes the number of base objects that can fail

NB. In the asynchronous model, it is impossible to distinguish a non-responsive from a slow object

Algorithms

- (1) Implements a SWMR **register** out of $t+1$ SWMR base responsive failure-prone **registers**
- (2) Implements a SWSR **register** out of $2t+1$ SWSR base non-responsive failure-prone **registers**

Responsive model

- Write(v)
 - For $j = 1$ to $(t+1)$ do
 - $\text{Reg}[j].\text{write}(v);$
 - return(ok)
- Read()
 - For $j = t+1$ to 1 do
 - $v := \text{Reg}[j].\text{read}();$
 - if $v \neq \perp$ then return(v)

Non-responsive model

- Init: $seq := 1$
- Write(v)
 - $w_seq := w_seq + 1;$
 - For $j = 1$ to $(2t+1)$ do **||**:
 - $Reg[j].write(w_seq, v);$
 - « wait until a majority of oks are returned »
 - return(ok)

Non-responsive model

- Init: $(sn, val) := (-1, \perp)$;
- Read()
 - For $j = 1$ to $(2t+1)$ do **||**:
 - $(s, v) := \text{Reg}[j].\text{read}()$;
 - $(sn, val) := (s, v)$ with the highest s from majority, including (sn, val)
 - return (val)
