## Concurrent Algorithms

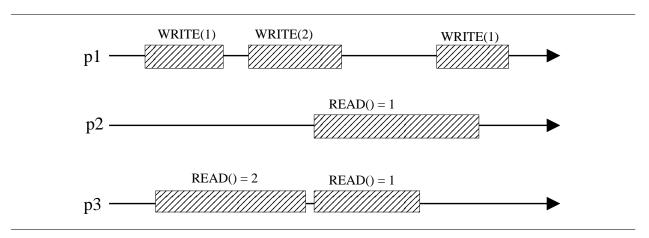

September 28, 2016

## Exercise 1

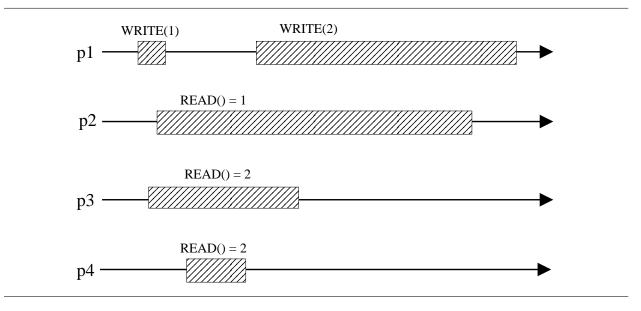

**Problem 1.** Each of the following executions represents a run of an algorithm that implements a read/write register. For each execution:

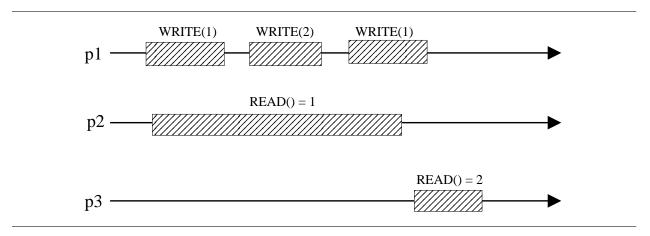

- Specify whether the execution is: *atomic, regular, safe,* or *none-of-the-above*. Explain why this is the case.
- If the execution is atomic, draw in the serialization points.

## Part 1.a.

## Part 1.b.

**Problem 2.** Consider the transformation from binary MRSW safe registers to binary MRSW regular registers, given in class. Prove that the transformation does **not** generate multi-valued MRSW regular registers (by providing a counterexample that breaks regularity). Also, prove that the resulting registers are not binary atomic (by providing a counterexample that breaks atomicity).

**Problem 3.** Consider the transformation from binary regular to M-valued MRSW regular registers given in class. Prove that:

- 1. The resulting registers are regular.
- 2. The transformation would not work if the Write operation would first write 0, and then 1. (You should provide a counterexample that breaks regularity.)
- 3. The resulting registers are not atomic. (You should provide a counterexample execution that breaks atomicity.)
