

# Concurrent Algorithms 2014

## Exercise 7

November 11, 2014

### Problem 1

A *k-set-agreement* object is a generalization of a consensus object in which processes could decide up to  $k$  different values. Formally, *k-set-agreement* satisfies the following properties:

1. *Validity*: Values decided by each process are the values proposed some processes.
2. *Agreement*: At most  $k$  different values could be decided.
3. *Termination*: Every correct process eventually decides a value.

**Your task** is to show that *k-set-agreement* and *k-consensus*, given in the class, are equivalent. That is, you have to show that one implements the other.

### Problem 2

Below is an algorithm that implements a single state machine replication using consensus shared objects:

**Local:**

```
sM                // a copy of the state machine
Commands          // a list of command
ready             // binary register (initially true)
```

**Shared:**

```
Consensus        // a list of shared consensus objects
```

```
while(true) {
  if ready then c = Commands.next()
  cons = Consensus.next()
  c' = cons.propose(c)
  sM.perform(c')
  if c' == c then ready = true
  else ready = false
}
```

The algorithm ensures the following correctness properties:

1. *Validity*: If a process  $p_i$  performs command  $c$ , then  $c$  was issued by some process  $p_j$  and  $p_i$  performed every command issued by  $p_j$  before  $c$ .
2. *Ordering*: If a process performs command  $c$  without having performed command  $c'$ , then no process performs  $c'$  without having performed  $c$ .
3. *Progress*: Every correct process performs an infinite number of commands on the state machine.

However the algorithm is not *fair*, i.e. it does not ensure the following property:

- *Fairness*: If a correct process issues command  $c$ , then it eventually performs  $c$  on the state machine.

**Your task:**

1. Show why the algorithm does not ensure fairness, i.e. show an execution violating the property.
2. Modify the algorithm so that the resulting algorithm would ensure fairness.
