# Distributed systems 

## Causal Broadcast

Prof R. Guerraoui

Distributed Programming Laboratory

## Overview

r Intuitions: why causal broadcast?
$\checkmark$ Specifications of causal broadcast
r Algorithms:
$\checkmark$ A non-blocking algorithm using the past and
$\checkmark$ A blocking algorithm using vector clocks

## Broadcast

## Intuition (1)

$\checkmark$ So far, we did not consider ordering among messages; In particular, we considered messages to be independent
$r$ Two messages from the same process might not be delivered in the order they were broadcast
$r$ A message $m 1$ that causes a message $m 2$ might be delivered by some process after m 2

## Intuition (2)

$r$ Consider a system of news where every new event that is displayed in the screen contains a reference to the event that caused it, e.g., a comment on some information includes a reference to the actual information
$r$ Even uniform reliable broadcast does not guarantee such a dependency of delivery

## Intuition

r Causal broadcast alleviates the need for the application to deal with message dependencies

## Modules of a process

## Overview

$\checkmark$ Intuitions: why causal broadcast?
r Specifications of causal broadcast
$r$ Algorithms:
$\checkmark$ A non-blocking algorithm using the past and
$r$ A blocking algorithm using vector clocks

## Causal broadcast

$r$ Events
r Request: <coBroadcast, m>
r Indication: <coDeliver, src, m>

- Property:
- Causal Order (CO)

## Causality

$\checkmark$ Let m1 and m2 be any two messages: m1 -> m2 (m1 causally precedes m2) iff
r C1 (FIFO order). Some process pi broadcasts m 1 before broadcasting m 2
r C2 (Local order). Some process pi delivers m 1 and then broadcasts m 2
$r$ C3 (Transitivity). There is a message m3 such that $\mathrm{m} 1->\mathrm{m} 3$ and $\mathrm{m} 3->\mathrm{m} 2$

## Causal broadcast

r Events
r Request: <coBroadcast, m>
r Indication: <coDeliver, src, m>

- Property:
- CO: If any process pi delivers a message m 2 , then pi must have delivered every message m 1 such that $\mathrm{m} 1->\mathrm{m} 2$

## Causality ?

## Causality ?

## Causality ?

## Reliable causal broadcast (rcb)

r Events
r Request: <rcoBroadcast, m>
$r$ Indication: <rcoDeliver, src, m>

- Properties:
- RB1, RB2, RB3, RB4 +
- CO

## Uniform causal broadcast (ucb)

$r$ Events
r Request: <ucoBroadcast, m>
r Indication: <ucoDeliver, src, m>

- Properties:
- URB1, URB2, URB3, URB4 +
- CO

## Overview

r Intuitions: why causal broadcast?
$\checkmark$ Specifications of causal broadcast
r Algorithms:
$\checkmark$ A non-blocking algorithm using the past and
$\checkmark$ A blocking algorithm using vector clocks

## Algorithms

$\checkmark$ We present reliable causal broadcast algorithms using reliable broadcast
$\checkmark$ We obtain uniform causal broadcast algorithms by using instead an underlying uniform reliable broadcast

## Algorithm 1

r Implements: ReliableCausalOrderBroadcast (rco).
r Uses: ReliableBroadcast (rb).
$r$ upon event < Init > do
$r$ delivered := past := $\varnothing$;
$r$ upon event < rcoBroadcast, m> do
r trigger < rbBroadcast, [Data,past,m]>;
r past := past U \{[self,m]\};

## Algorithm 1 (cont'd)

r upon event <rbDeliver,pi,[Data,pastm,m]> do
r if $m \notin$ delivered then
$r(*)$ forall $[\mathrm{sn}, \mathrm{n}] \in$ pastm do
if $\mathrm{n} \notin$ delivered then
trigger < rcoDeliver,sn,n>;
delivered := delivered $U\{n\} ;$
$r$ past := past U \{[sn, n]\};

## Algorithm 1 (cont'd)

$r$ (*)
$r$ trigger <rcoDeliver,pi,m>;
$r$ delivered := delivered $U\{m\}$;
r past := past U \{[pi,m]\};

## Algorithm 1

## Algorithm 1

## Uniformity

$r$ Algorithm 1 ensures causal reliable broadcast
$r$ If we replace reliable broadcast with uniform reliable broadcast, Algorithm 1 would ensure uniform causal broadcast

## Algorithm 1' (gc)

r Implements: GarbageCollection (+ Algo 1).
$r$ Uses:
$r$ ReliableBroadcast (rb).
r PerfectFailureDetector(P).
$\checkmark$ upon event < Init > do
r delivered := past := empty;
r correct :=S;
r ackm := $\varnothing$ (for all m);

## Algorithm 1' (gc - cont'd)

r upon event < crash, pi > do
r correct := correct <br>{pi\} }

- upon for some $m \in$ delivered: self $\notin$ ackm do
- ackm := ackm U \{self\};
- trigger < rbBroadcast, [ACK,m]>;

## Algorithm 1' (gc - cont'd)

$\checkmark$ upon event <rbDeliver,pi,[ACK,m]> do
r ackm := ackm U \{pi\};
$\checkmark$ upon event correct $\subseteq$ ackm do
r past := past <br>{[sm, m]\}; }

## Algorithm 2

r Implements: ReliableCausalOrderBroadcast (rco).
r Uses: ReliableBroadcast (rb).
r upon event < Init > do
$r$ for all pi $\in S$ : VC[pi] := 0;
$\checkmark$ pending $:=\varnothing$

## Algorithm 2 (cont'd)

$r$ upon event < rcoBroadcast, $\mathrm{m}>$ do
$r$ trigger < rcoDeliver, self, m>;
r trigger < rbBroadcast, [Data,VC,m]>;
r VC[self] := VC[self] + 1;

## Algorithm 2 (cont'd)

$r$ upon event <rbDeliver, pj, [Data,VCm,m]> do
$\checkmark$ if $\mathrm{pj} \neq$ self then
$\checkmark$ pending $:=$ pending $\cup(\mathrm{pj},[$ Data, $\mathrm{VCm}, \mathrm{m}])$;
$r$ Deliver-pending.

## Algorithm 2 (cont'd)

$\checkmark$ procedure deliver-pending is
$\checkmark$ While $(s,[D a t a, V C m, m]) \in$ pending s.t.
$r$ for all pk: (VC[pk] $\geq \mathrm{VCm}[\mathrm{pk}]$ ) do pending := pending - (s, [Data,VCm,m]); trigger < rcoDeliver, self, m>;
$r \operatorname{VC}[\mathrm{~s}]:=\mathrm{VC}[\mathrm{s}]+1$.

## Algorithm 2

## Algorithm 2
